Department of Computer Science and Engineering
CO1 ASSESSMENT TOOL 2 – Agile Sprint Planning & User Story Workshop

Course Code:	CSA10 / CSA1063	Course Title:	Software Engineering
CO Assessed:	CO1	Assessment:	Assessment Tool 2 – Agile Sprint Planning & User Story Workshop
Weightage:	20%	Total Marks:	25
CO1 Statement:	<i>Apply advanced methodologies and agile project management techniques to manage software projects effectively</i>		
Student Name:	MALLI CHANDANA	Reg. No.:	192472250
Date:	27-07-2026	Duration:	60 minutes

Code of Conduct

I MALLI CHANDANA(192472250) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: M.CHANDANA

Annexure A – Agile Sprint Planning & User Story Workshop

Eco-Tourism Management and Sustainable Travel Recommendation System

Introduction

Eco-tourism is one of the fastest-growing sectors in the tourism industry because it promotes responsible travel while protecting the environment, wildlife, and local communities. Unlike traditional tourism, eco-tourism focuses on conserving natural resources, reducing pollution, and encouraging sustainable development. However, many tourists still find it difficult to identify eco-friendly destinations, sustainable accommodations, green transportation, and environmentally responsible travel activities. Existing travel platforms mainly focus on booking services rather than providing recommendations based on sustainability. This often leads to increased environmental impact and a lack of awareness among travelers about responsible tourism practices. To overcome these challenges, the **Eco-Tourism Management and Sustainable Travel Recommendation System** is proposed as a smart digital platform. The system

provides personalized recommendations for eco-friendly destinations, green hotels, nature-based activities, and sustainable transportation options. It also allows users to book travel services, view destination details, receive environmental guidelines, and calculate their travel impact. Tourism authorities can use the platform to promote eco-tourism destinations, monitor visitor activities, and generate useful reports. By integrating technologies such as Artificial Intelligence (AI), cloud computing, GPS, and mobile applications, the proposed system enhances the travel experience while supporting environmental conservation and sustainable tourism development.

Key Points

- Promotes eco-friendly tourism.
- Encourages responsible travel.
- Supports environmental conservation.
- Recommends sustainable destinations.
- Provides online booking facilities.
- Uses AI and cloud technologies.
- Benefits tourists and local communities.

1. Identify the Project Vision and Stakeholders

The **Eco-Tourism Management and Sustainable Travel Recommendation System** aims to create a digital platform that encourages sustainable travel and environmental conservation. The project focuses on helping tourists make responsible travel decisions by recommending eco-friendly destinations, green accommodations, and sustainable transportation options. It also promotes awareness about environmental protection and supports local communities that depend on eco-tourism for their livelihood. The system provides a single platform where users can search destinations, receive personalized travel recommendations, book eco-friendly services, and access important travel information. Tourism authorities can efficiently manage eco-tourism activities, monitor visitor statistics, and promote conservation initiatives through the platform. Local businesses such as eco-resorts, restaurants, transport providers, and tour operators can attract more environmentally conscious travelers. The project combines modern software technologies with sustainability principles to improve tourism services while protecting natural resources. By focusing on user satisfaction, environmental responsibility, and digital innovation, the system contributes to long-term sustainable tourism development.

Key Points

- Promotes sustainable tourism.
- Encourages responsible travel.
- Supports environmental conservation.
- Improves tourist experience.
- Helps local communities.
- Provides personalized recommendations.
- Uses modern digital technologies.

1.1 Project Vision

The vision of the **Eco-Tourism Management and Sustainable Travel Recommendation System** is to develop a smart, reliable, and user-friendly platform that promotes environmentally responsible tourism. The platform encourages travelers to choose destinations, accommodations, and transportation options that have minimal impact on the environment. It aims to create awareness about sustainable tourism practices while supporting biodiversity conservation and local cultural heritage. The system helps tourists make informed decisions by providing accurate information, personalized recommendations, and eco-

friendly travel suggestions. It also enables tourism authorities to promote protected areas, monitor tourist activities, and encourage responsible tourism policies. By integrating Artificial Intelligence (AI), cloud computing, and GPS technologies, the platform offers efficient and intelligent travel planning. The vision also includes supporting local communities by increasing opportunities for eco-friendly businesses and preserving natural resources for future generations. Overall, the system aims to build a balance between tourism growth, environmental protection, and community development through digital innovation.

Key Points

- Promote sustainable tourism.
- Protect natural resources.
- Encourage eco-friendly travel.
- Support biodiversity conservation.
- Increase environmental awareness.
- Improve travel planning.
- Support local communities.

1.2 Project Objectives

The primary objective of the proposed system is to encourage sustainable tourism by providing travelers with eco-friendly travel recommendations through an intelligent digital platform. The system aims to simplify travel planning by integrating destination search, accommodation booking, transportation, and environmental information into a single application. It also focuses on increasing awareness about responsible tourism and reducing the environmental impact caused by traditional travel practices. Another objective is to provide personalized recommendations using Artificial Intelligence based on user interests, travel history, and environmental preferences. The platform enables tourism authorities to manage eco-tourism destinations, monitor visitor activities, and generate useful reports for planning and decision-making. It also supports local businesses by promoting eco-friendly hotels, restaurants, transport providers, and community-based tourism services. Through the use of modern software technologies, the proposed system improves user satisfaction while promoting sustainable development and environmental conservation.

Key Points

- Recommend eco-friendly destinations.

- Simplify travel planning.
- Promote responsible tourism.
- Reduce environmental impact.
- Support local businesses.
- Provide AI-based recommendations.
- Improve tourism management.

1.3 Identify the Stakeholders

The success of the **Eco-Tourism Management and Sustainable Travel Recommendation System** depends on the active participation of various stakeholders who contribute to its development, operation, and continuous improvement. The primary stakeholders include domestic and international tourists who use the platform to discover eco-friendly destinations, plan sustainable trips, and book travel services. Tourism departments and eco-tourism authorities are responsible for promoting destinations, preserving natural resources, and monitoring tourism activities. Local communities benefit by providing eco-friendly services such as accommodation, food, handicrafts, and guided tours. Hotels, transport providers, and travel agencies use the platform to promote sustainable tourism services. Software developers and technical teams are responsible for designing, developing, testing, and maintaining the application. System administrators manage users, update destination information, monitor bookings, and ensure data security. The collaboration of all stakeholders ensures that the platform remains reliable, efficient, and beneficial for both travelers and the environment.

Key Points

- Domestic tourists.
- International tourists.
- Tourism Department.
- Eco-Tourism Authorities.
- Local Communities.
- Hotels and Resorts.
- Transport Providers.
- Travel Agencies.
- System Administrator.
- Software Development Team.

Who are the stakeholders in a project?

2.1 Epic 1 – User Management

The **User Management Epic** focuses on providing secure access to the system for different users. It allows tourists to register, log in, manage their profiles, and update personal preferences. A secure authentication process ensures that user information remains protected while allowing access to personalized travel recommendations. The profile management feature enables users to save their travel interests, preferred destinations, budget, and sustainability preferences, allowing the system to generate more accurate recommendations. This Epic also improves the overall user experience by making account management simple and secure. By maintaining user profiles, the platform can provide customized services that increase user satisfaction and encourage repeat usage.

Key Points

- User registration.
- Secure login.
- Password management.
- Profile management.
- Personalized preferences.
- Secure authentication.
- Better user experience.

User Stories

US1: As a **tourist**, I want to register an account so that I can access the platform securely.

US2: As a **tourist**, I want to log in using my credentials so that I can access personalized travel recommendations.

US3: As a **tourist**, I want to update my profile and travel preferences so that I receive recommendations based on my interests.

2.2 Epic 2 – Eco-Tourism Recommendation

The **Eco-Tourism Recommendation Epic** is the core functionality of the proposed system. It helps users discover eco-friendly destinations based on their interests, travel history, budget, and environmental preferences. The recommendation engine uses Artificial Intelligence to analyze user preferences and

suggest sustainable travel options. It also provides information about eco-friendly accommodations, green transportation, and nature-based activities. These recommendations encourage responsible tourism while helping travelers reduce their environmental impact. By offering personalized suggestions, the system improves travel planning and enhances the overall user experience.

Key Points

- Eco-friendly destination search.
- AI-based recommendations.
- Sustainable travel planning.
- Green accommodation suggestions.
- Eco-friendly transportation.
- Personalized recommendations.
- Improved travel experience.

User Stories

US4: As a **tourist**, I want eco-friendly destination recommendations so that I can travel responsibly.

US5: As a **tourist**, I want personalized travel suggestions so that I can plan better trips.

US6: As a **tourist**, I want recommendations for green hotels and transport so that I can reduce my environmental impact.

2.3 Epic 3 – Booking Management

The **Booking Management Epic** enables tourists to book eco-friendly accommodations, transportation, and travel packages through the platform. It provides a secure online booking process that saves time and improves convenience. Users can view booking details, receive confirmation messages, and manage their reservations from a single application. The booking module also integrates secure payment gateways to ensure safe online transactions. By combining booking services with travel recommendations, the platform offers a complete travel planning experience.

Key Points

- Online booking.

- Secure payment.
- Booking confirmation.
- Reservation management.
- Travel package booking.
- Easy cancellation.
- Improved convenience.

User Stories

US7: As a **tourist**, I want to book eco-friendly hotels so that I can complete my travel plans easily.

US8: As a **tourist**, I want secure online payments so that my transactions remain safe.

US9: As a **tourist**, I want to view my booking history so that I can manage my trips.

2.4 Epic 4 – Feedback and Review Management

The **Feedback and Review Epic** allows users to share their travel experiences after visiting eco-tourism destinations. Tourists can provide ratings, write reviews, and suggest improvements for destinations and services. These reviews help other travelers make informed decisions and assist tourism authorities in improving service quality. The feedback collected by the system also helps developers identify areas that require improvement. This feature promotes transparency and increases user trust in the platform.

Key Points

- Ratings and reviews.
- Share travel experiences.
- Improve service quality.
- Help future travelers.
- Collect user feedback.
- Increase platform trust.
- Support continuous improvement.

User Stories

US10: As a **tourist**, I want to rate destinations so that I can share my experience.

US11: As a **tourist**, I want to submit reviews so that other travelers can benefit.

2.5 Epic 5 – Administration

The **Administration Epic** enables system administrators to manage the entire platform efficiently. Administrators can update destination information, verify user accounts, monitor bookings, generate reports, and maintain system security. They are also responsible for adding new eco-tourism destinations, removing outdated content, and monitoring platform performance. This Epic ensures that the system remains reliable, secure, and up-to-date. Effective administration supports smooth system operation and improves the quality of services provided to users.

Key Points

- User management.
- Destination management.
- Booking monitoring.
- Report generation.
- Content updates.
- Security management.
- System maintenance.

User Stories

US12: As an **administrator**, I want to manage user accounts so that I can maintain system security.

US13: As an **administrator**, I want to update destination information so that users receive accurate and current details.

US14: As an **administrator**, I want to generate reports so that I can monitor eco-tourism activities.

3. Define Acceptance Criteria

Acceptance criteria are an important part of Agile development because they clearly define the conditions that must be satisfied before a user story is considered complete. They help developers, testers, and stakeholders understand the expected behavior of the system and ensure that every feature works as intended. In the **Eco-Tourism Management and Sustainable Travel Recommendation System**, acceptance criteria are written using the **Given–When–Then** format, which makes each requirement clear, measurable, and easy to test. This approach reduces misunderstandings, improves software quality, and ensures that the developed features meet user expectations. Acceptance criteria also support continuous testing during each sprint and help the development team verify that the delivered functionality aligns with the project requirements. By defining clear acceptance criteria for every user story, the project achieves better communication, higher reliability, and successful Agile implementation.

Key Points

- Defines expected system behavior.
- Makes user stories measurable.
- Reduces misunderstandings.
- Supports software testing.
- Ensures user satisfaction.
- Improves software quality.
- Follows the Given–When–Then format.

3.1 Acceptance Criteria for User Management

The **User Management** module ensures that users can securely register, log in, and manage their profiles. The acceptance criteria verify that the registration process stores user details correctly, login credentials are validated, and profile updates are saved successfully. Security measures such as password validation and authentication are also verified before allowing users to access the system. These criteria help ensure that only authorized users can use the platform and that their personal information remains protected. Proper testing of this module improves system security, reliability, and user confidence while providing a smooth login experience.

Key Points

- Secure registration.
- Valid login credentials.
- Profile update verification.
- Password validation.
- Authentication checks.
- Protected user data.
- Smooth user access.

Acceptance Criteria

User Story 1 – User Registration

Given the user is on the registration page

When valid personal details are entered and the Register button is clicked

Then the system should create a new user account and display a successful registration message.

User Story 2 – User Login

Given the registered user is on the login page

When a valid username and password are entered

Then the system should allow the user to access the dashboard successfully.

User Story 3 – Profile Management

Given the user is logged in

When profile details are updated and saved

Then the system should display the updated information successfully.

3.2 Acceptance Criteria for Eco-Tourism Recommendation

The **Eco-Tourism Recommendation** module is responsible for suggesting sustainable travel options based on user preferences. The acceptance criteria ensure that the recommendation engine provides

relevant eco-friendly destinations, green hotels, and transportation options according to the user's selected interests. The system should display recommendations quickly and accurately while allowing users to filter search results. Proper testing of this module ensures that users receive personalized suggestions that support sustainable tourism and improve travel planning.

Key Points

- Personalized recommendations.
- Destination filtering.
- Green hotel suggestions.
- Eco-friendly transport.
- Accurate search results.
- AI-based recommendations.
- Better travel planning.

Acceptance Criteria

User Story 4 – Eco-Friendly Destination Recommendation

Given the tourist selects travel preferences

When the Search button is clicked

Then the system should display suitable eco-friendly destinations.

User Story 5 – Personalized Recommendation

Given the user's travel history is available

When recommendations are requested

Then the system should suggest destinations based on previous interests.

User Story 6 – Sustainable Accommodation

Given the tourist selects a destination

When accommodation options are viewed

Then only eco-friendly hotels should be displayed.

3.3 Acceptance Criteria for Booking Management

The **Booking Management** module allows users to book eco-friendly accommodations and transportation through a secure online platform. The acceptance criteria verify that bookings are processed correctly, payment transactions are completed securely, and booking confirmations are generated successfully. The system should also allow users to view their booking history and manage existing reservations. These criteria ensure that the booking process is reliable, efficient, and user-friendly while maintaining data security.

Key Points

- Secure booking.
- Online payment.
- Booking confirmation.
- Booking history.
- Reservation management.
- Transaction security.
- Easy cancellation.

Acceptance Criteria

User Story 7 – Hotel Booking

Given the tourist selects an eco-friendly hotel

When the booking is confirmed

Then the system should generate a booking confirmation.

User Story 8 – Online Payment

Given the booking details are verified

When payment is completed

Then the transaction should be processed securely and a payment receipt should be generated.

User Story 9 – Booking History

Given the user is logged in

When the Booking History option is selected

Then all previous bookings should be displayed.

3.4 Acceptance Criteria for Feedback and Review

The **Feedback and Review** module enables users to rate destinations and share their travel experiences. The acceptance criteria verify that users can submit ratings and reviews successfully after completing their trips. Reviews should be displayed correctly for other travelers while preventing invalid or duplicate submissions. This module helps improve service quality and provides valuable information for future visitors.

Key Points

- Submit ratings.
- Share reviews.
- Display feedback.
- Prevent duplicate reviews.
- Improve service quality.
- Increase user trust.
- Help future travelers.

Acceptance Criteria

User Story 10 – Rating Destination

Given the tourist has completed the trip

When a rating is submitted

Then the system should save and display the rating successfully.

User Story 11 – Submit Review

Given the tourist enters review comments

When the Submit button is clicked

Then the review should be stored and displayed successfully.

3.5 Acceptance Criteria for Administration

The **Administration** module allows administrators to manage users, destinations, bookings, and reports. The acceptance criteria verify that administrators can update destination information, manage user accounts, generate reports, and monitor platform activities successfully. This module ensures that the platform remains accurate, secure, and up-to-date while supporting efficient system administration.

Key Points

- User management.
- Destination updates.
- Report generation.
- Booking monitoring.
- System security.
- Content management.
- Platform maintenance.

Acceptance Criteria

User Story 12 – User Management

Given the administrator is logged in

When a user account is modified

Then the system should save the updated user information successfully.

User Story 13 – Destination Management

Given the administrator edits destination details

When the Save button is clicked

Then the updated destination information should be available to users.

User Story 14 – Report Generation

Given the administrator selects a reporting period

When the Generate Report button is clicked

Then the system should generate and display the required report successfully.

4. Prioritize the Product Backlog

The **Product Backlog** is a prioritized list of all the features, enhancements, and tasks required to develop the **Eco-Tourism Management and Sustainable Travel Recommendation System**. It helps the development team focus on delivering the most valuable features first. The backlog is prioritized based on business value, customer requirements, and project dependencies. High-priority items such as user registration, destination recommendations, and booking management are completed before additional features like reviews and notifications. Regular backlog refinement ensures that new requirements and user feedback are included throughout the Agile development process.

Key Points

- Prioritizes project requirements.
- Focuses on business value.
- Delivers important features first.
- Supports Agile development.
- Updated regularly.
- Improves project planning.
- Ensures customer satisfaction.

4.1 Product Backlog Prioritization

The first sprint focuses on essential features required to build the basic version of the system. Features that directly improve the user experience and support sustainable travel are given the highest priority. Less critical features are planned for future sprints after the core functionalities are completed.

Priority	Product Backlog Item	Priority Level
1	User Registration & Login	High
2	Eco-Friendly Destination Search	High
3	Travel Recommendation System	High
4	Online Booking	High
5	User Profile Management	Medium
6	Feedback & Reviews	Medium
7	Admin Dashboard	Medium

8	Notifications	Low
---	---------------	-----

Key Points

- High-priority features developed first.
- Customer needs are considered.
- Dependencies are identified.
- Supports incremental development.
- Easy backlog management.
- Continuous refinement.
- Improves sprint planning.

5. Plan the Sprint Backlog

The **Sprint Backlog** contains the selected user stories and development tasks that the team plans to complete during a single sprint. It is created from the high-priority items in the Product Backlog and focuses on delivering a working product increment. For the **Eco-Tourism Management and Sustainable Travel Recommendation System**, Sprint 1 concentrates on developing the core features required for the Minimum Viable Product (MVP). These features include user registration, login, eco-friendly destination search, recommendation functionality, and basic booking support. The development team divides each user story into smaller tasks such as designing, coding, testing, and documentation. By following the Sprint Backlog, the team can track progress, complete tasks efficiently, and deliver quality software within the sprint duration.

Key Points

- Sprint contains high-priority user stories.
- Focuses on core system features.
- Tasks are divided among developers.
- Progress is tracked daily.
- Supports iterative development.
- Delivers a working product increment.
- Improves teamwork and productivity.

5.1 Sprint Backlog Tasks

The first sprint is planned to develop the essential modules of the system that allow users to access the platform and receive sustainable travel recommendations. Each selected user story is divided into actionable tasks to ensure smooth implementation and timely completion. Testing and documentation are also included to maintain software quality and prepare the system for the next sprint.

User Story	Development Tasks
User Registration	Design registration page, Develop registration module, Validate user input, Test registration
User Login	Create login page, Implement authentication, Test login functionality

Destination Search	Develop search interface, Connect database, Display eco-friendly destinations
Recommendation System	Implement recommendation logic, Display personalized suggestions
Online Booking	Develop booking page, Integrate payment gateway, Generate booking confirmation

Key Points

- Registration module development.
- Login authentication.
- Destination search implementation.
- Recommendation engine development.
- Booking module implementation.
- Unit testing and bug fixing.
- Documentation and sprint review.

6. Estimate Effort Using Story Points

Story Point Estimation is an important Agile practice used to measure the effort, complexity, and time required to complete each user story. Instead of estimating work in hours, Agile teams use **Story Points** to compare the relative size of tasks. For the **Eco-Tourism Management and Sustainable Travel Recommendation System**, the **Fibonacci sequence (1, 2, 3, 5, 8, 13)** is used because it is simple, widely accepted in Scrum, and helps estimate development effort more accurately. Features that are easy to implement receive fewer story points, while complex features requiring more coding, testing, and integration receive higher story points. Proper estimation helps the development team plan realistic sprint workloads, improve productivity, and deliver quality software within the sprint duration.

Key Points

- Uses Fibonacci sequence.
- Measures effort and complexity.
- Helps in sprint planning.
- Improves workload distribution.
- Supports realistic scheduling.
- Reduces development risks.
- Enhances team productivity.

6.1 Story Point Estimation

The selected user stories for Sprint 1 are estimated based on their complexity, dependencies, and development effort. Simple features such as login require fewer story points, while modules like recommendation and booking require more effort due to database integration, business logic, and testing. These estimates help the Scrum team understand the amount of work that can be completed during a sprint and ensure balanced task allocation.

User Story	Story Points	Justification
User Registration	3	Simple form validation and database storage
User Login	2	Basic authentication functionality

Destination Search	5	Search logic and database integration
Eco-Tourism Recommendation	8	AI-based recommendation logic and personalization

Key Points

- Registration – 3 Story Points.
- Login – 2 Story Points.
- Destination Search – 5 Story Points.
- Recommendation System – 8 Story Points.
- Online Booking – 8 Story Points.
- Estimates based on complexity.
- Supports balanced sprint planning.

7. Present the Sprint Goal and Expected Deliverables

The **Sprint Goal** defines the main objective that the development team aims to achieve during the first sprint. For the **Eco-Tourism Management and Sustainable Travel Recommendation System**, the goal is to develop the core functionalities that allow users to access the platform and receive eco-friendly travel recommendations. During this sprint, the team focuses on implementing essential modules such as user registration, secure login, destination search, recommendation generation, and basic online booking. Completing these features provides a functional prototype that can be reviewed by stakeholders for feedback. The expected deliverables include a working application with the completed modules, basic database integration, testing reports, and project documentation. These deliverables provide a strong foundation for future sprints, where additional features such as reviews, notifications, and advanced recommendation techniques can be developed. By achieving the sprint goal, the team ensures continuous progress while following Agile Scrum principles and delivering value to users.

Key Points

- Develop a functional prototype.
- Complete core system modules.
- Implement secure login and registration.
- Provide eco-tourism recommendations.
- Enable basic online booking.
- Complete testing and documentation.
- Prepare for future sprint enhancements.

7.1 Sprint Goal

Sprint Goal:

To develop a functional prototype of the Eco-Tourism Management and Sustainable Travel Recommendation System with user registration, login, eco-friendly destination search, personalized travel recommendations, and basic online booking features.

7.2 Expected Deliverables

- User Registration Module.

- Secure Login System.
- User Profile Management.
- Eco-Friendly Destination Search.
- Sustainable Travel Recommendation Module.
- Basic Online Booking Module.
- Database Integration.
- Unit Testing Report.
- Sprint Review Report.
- Project Documentation.

Key Points

- Functional prototype completed.
- Core modules implemented.
- Database connected successfully.
- Software tested.
- Documentation prepared.
- Ready for stakeholder review.
- Supports future sprint development.

Conclusion

The **Eco-Tourism Management and Sustainable Travel Recommendation System** provides an effective digital solution for promoting sustainable tourism and responsible travel practices. Through Agile Scrum methodology, the project is developed in small, manageable sprints that encourage continuous improvement, stakeholder collaboration, and early delivery of working software. The use of Epics, User Stories, Acceptance Criteria, Product Backlog, Sprint Backlog, and Story Point Estimation ensures that the project is well organized and aligned with user requirements. The proposed system helps travelers discover eco-friendly destinations, supports local communities, and encourages environmental conservation while improving the overall travel experience. By following Agile software engineering practices, the development team can deliver a reliable, scalable, and user-friendly application that meets business objectives and adapts to future enhancements. Overall, the project demonstrates how Agile planning contributes to the successful development of a modern, sustainable tourism management system.

Rubrics for Calculation

Criteria	Excellent (5 Marks)	Good (3 Marks)	Satisfactory (2 Marks)	Needs Improvement (1 Mark)
Project Vision & Stakeholder Identification	Project vision is clear, comprehensive, and aligned with the problem statement. All relevant stakeholders and their roles are correctly identified.	Vision is clear with minor omissions. Most stakeholders are correctly identified.	Vision is partially defined. Some stakeholders are missing or incorrectly identified.	Vision is unclear or incomplete. Stakeholders are poorly identified or missing.
Epics & User Stories	Epics are well-defined and user stories are complete, follow Agile format, and fully capture functional requirements.	Epics and user stories are mostly complete with minor formatting or requirement issues.	User stories are partially complete with limited Agile structure.	User stories are incomplete, unclear, or do not follow Agile practices.
Acceptance Criteria	Acceptance criteria are specific, measurable, testable, and aligned with all user stories.	Acceptance criteria are mostly clear and testable with minor gaps.	Acceptance criteria are partially defined and lack clarity or completeness.	Acceptance criteria are missing or not aligned with user stories.
Product Backlog Prioritization & Sprint Planning	Product backlog is logically prioritized, sprint backlog is realistic, and task breakdown is complete.	Backlog prioritization and sprint planning are mostly appropriate with minor issues.	Prioritization or sprint planning is partially complete with limited justification.	Backlog prioritization and sprint planning are poorly organized or incomplete.
Story Point Estimation, Sprint Goal & Presentation	Story point estimation is well justified, sprint goal is clear, deliverables are realistic, and presentation is professional and well organized.	Estimation and sprint goal are mostly appropriate with minor inconsistencies. Presentation is clear.	Estimation or sprint goal lacks justification. Presentation is adequate but incomplete.	Estimation is unrealistic or missing. Sprint goal, deliverables, and presentation are unclear or incomplete.

Criteria	Mark
Project Vision & Stakeholder Identification	/5
Epics & User Stories	/5
Acceptance Criteria	/5
Product Backlog Prioritization & Sprint Planning	/5
Story Point Estimation, Sprint Goal & Presentation	/5
TOTAL	/25
